

1 Define the comparison

Replaceable input blocks
Common feasible set and clock

2 Choose a comparator

Attainable prior-selected rule
Fix controller and accounting

4 Layer B: action response

Common-state outer ranges
Tolerance; overlap inconclusive

3 Layer A: input allocation

Four chronological replays
 $T + C = D$; each carries stock

5 Layer C: updating branches

First-only versus sustained use
Failures; no summing windows

6 Report value and costs

Comparator-specific value
Adoption needs measured costs

Static certificates anchor layer B.
Layer C measures consequences outside those bounds.
